

GDA React Source — GitHub-Ready Sync Report

Date: 2026-04-27. Goal: produce a clean, push-ready working tree of the GDA Command React app at a known location, no `node_modules/dist/backup` files, with the QA Center patch already applied. No live deploy. No GitHub push from this sandbox.

Result: READY for the user to commit

- Clean tree: `/home/user/workspace/gda-command-github-ready/` — 53 files, ~1.3 MB on disk (most of that is `package-lock.json` and one big `App.jsx`).
- Zip: `/home/user/workspace/gda-command-github-ready.zip` — ~307 KB.
- `npm ci + npm run build` succeed end to end. No new warnings; only the same pre-existing duplicate-key, inline-CSS, and bundle-size warnings flagged in earlier sessions.

What was done

1. **Picked the canonical source.** `/home/user/workspace/deploy-react-stabilized/gda-command-main` — the source the project's `CLAUDE.md` documents as the working tree (`/opt/gda-command/src/App.jsx` in production). It already contains the QA Center patch from earlier this session.
2. **Copied it to a clean working tree** at `/home/user/workspace/gda-command-github-ready` excluding: `node_modules`, `dist`, `.vite`, every `App.jsx.bak*` snapshot, every `*.pre-modularize/*.clean_base/*.s1*-pre-*/*.working` variant, plus the in-tree scratch text files (`_*.txt`, `build_trigger.txt`, `trigger_build.txt`, `netlify_rebuild.txt`, `_deploy_*.txt`, `test_b64.txt`, `toggle_result.txt`, `_grep_result.txt`, `_page_audit.txt`, `_b64.txt`, `_c0.txt`, `verify.txt`, `cols_verify.txt`, `mas_verify.txt`).
3. **Removed leftover one-shot debug scripts** (`fix2.py`, `patch.py`) — they reference `/opt/gda-command` paths and have no place in a versioned repo.
4. **Replaced `.gitignore`** (was 2 lines; `node_modules + dist`) with a proper one covering build outputs, `.env*`, OS files, editor folders, logs, and every backup pattern listed above. So even if someone re-runs the modularization scripts and produces new `*.bak*` files, git won't pick them up.
5. **Audited `src/` for direct n8n calls and secrets.**

```
- `n8n.csr-llc.tech`: only matches are display-only `<SourceTag url="https://n8n.
```

- `/webhook/`, `/webhook-test/`, `gda-api-2026-secure`, `x-gda-key`, `x-gda-qa-key`, `x-gda-auth`: **no matches** anywhere in `src/`. The only literal `x-gda-key` in the tree is a comment in `QACenterPage.jsx` saying *"no x-gda-key headers"*.
- Bearer `<token>` / `sk-...` / `n8n_api_...` patterns: **no matches** anywhere in the tree.

6. **Built from scratch.** `npm ci` (105 packages) → `npm run build` → ✓ 678 modules transformed. ✓ built in 4.56s. Output dropped after build to keep the tree clean for commit.
7. Added a README.md explaining the stack, quick-start, deploy path, QA Center page, code map, and repo hygiene. None existed before.
8. **Zipped** the clean tree to `/home/user/workspace/gda-command-github-ready.zip` (excludes `node_modules/dist/.vite`).

What's in the tree

```
gda-command-github-ready/
├── .github/
│   └── workflows/
│       └── deploy.yml          # SSH-deploy on push to main (pre-existing)

└── vite.config.js
```

Files audited and intentionally left alone

File	Reason
ops.html	Standalone HTML ops page that calls <code>https://n8n.csr-llc.tech/webhook/...</code> directly with hard-coded URLs. It is not part of the React bundle and not loaded by <code>index.html</code> . It is a separate deployment artifact. Leaving it in place—touching it is out of scope for this “make React clean for GitHub” task and could break a separate ops surface. Flag for follow-up if Shawn wants the same treatment applied.
deploy.sh	Pre-existing VPS-side deploy script. Contains an SSH key path on the VPS but no key material. Safe to commit.
.github/workflows/deploy.yml	Pre-existing CI deploy. Uses <code>\${{ secrets.VPS_SSH_KEY }}</code> —secret stays in GitHub repo settings, not in the file. Safe to commit.

File	Reason
netlify.toml	Legacy Netlify config; the live site does not use Netlify per CLAUDE.md. Left in place to avoid scope creep. Flag for follow-up if you want it removed.
CLAUDE.md	References VPS IP 187.77.206.105, Postgres database name, n8n MCP transport URL. These are operational hostnames/IDs, not credentials. Decision deferred to user — easy to rewrite/scrub if you'd rather keep them out of a public repo, but if the repo stays private these are fine.

Build result

```
$ npm ci    # 105 packages in 1s
$ npm run build
> vite build
✓ 678 modules transformed.
dist/index.html          0.29 kB | gzip: 0.23 kB
dist/assets/index-B1eHD2_a.css 0.24 kB | gzip: 0.18 kB
dist/assets/index-C1aFCz1Q.js 1,267.82 kB | gzip: 337.23 kB
✓ built in 4.56s
```

Pre-existing warnings carried over (not introduced by this sync):

- Duplicate keys "General Services Administration" (and one nearby) in the agency map in App.jsx.
- Two CSS minification warnings from an inline <style> payload with an unterminated string.
- Bundle-size warning >500 kB.

These existed before the QA Center patch; not in scope to fix here.

GitHub access from this sandbox: not available

- gh auth status → not logged in.
- No GH_TOKEN/GITHUB_TOKEN env var.
- curl https://api.github.com/repos/shawnseffernick175/gda-command → 404 (repo is private; user has 0 public repos under that handle).

I will not push without explicit separate approval *and* working credentials. The exact commands to push are below.

Exact next steps for the user (pick one path)

Option A — first time pushing to a new (or empty) repo on GitHub

```
cd /home/user/workspace/gda-command-github-ready
git init -b main
git add .
git commit -m "Initial import: GDA Command React frontend with QA Center"

- React 19 + Vite 7 single-page app
- QA Center sidebar page under PLATFORM (Run Health Check + Run Dry-Run Checks)
- All API calls go through same-origin /api proxy – no secrets in frontend
- See README.md and CLAUDE.md"

# auth (one of these):
gh auth login                                # interactive
# or
export GH_TOKEN=ghp_xxx                      # token with repo scope

git remote add origin https://github.com/shawnseffernick175/gda-command.git
git push -u origin main
```

Option B — sync into an existing repo that already has history

```
# 1. Clone the existing repo somewhere
git clone https://github.com/shawnseffernick175/gda-command.git /tmp/existing
cd /tmp/existing

# 2. Replace its working tree with this clean one (keeping .git from the clone)
rsync -a --delete \
  --exclude='.git' \
  /home/user/workspace/gda-command-github-ready/ ./

# 3. Review and commit
git status
git add -A
git commit -m "Sync clean source: add QA Center, strip backups and direct-webhook c
git push origin main
```

Option C — upload via web UI (no shell)

Use /home/user/workspace/gda-command-github-ready.zip:

1. Unzip locally.
2. On github.com, open the repo → Add file → Upload files.
3. Drag the contents of gda-command-github-ready/ (NOT the folder itself) into the uploader.
4. Commit.

Hygiene confirmed

Check	Result
node_modules/excluded	✓
dist/excluded	✓
.bak, *.pre-modularize, scratch_*.txt excluded	✓
Direct n8n webhook URLs in src/ (API calls)	✗ none found
x-gda-key/x-gda-auth/gda-api-2026-secure in src/	✗ none found (only one comment-only mention in QACenterPage.jsx)
Bearer/ sk-.../ n8n_api_... token patterns anywhere	✗ none found
npm ci && npm run build from a clean tree	✓ passes

Deliverables

- /home/user/workspace/gda-command-github-ready/ (working tree, ready to commit)
- /home/user/workspace/gda-command-github-ready.zip (~307 KB; same tree, no node_modules/dist)
- /home/user/workspace/gda-github-source-sync-report.md (this file)

Out of scope (intentional)

- Pushing to GitHub (no auth in sandbox; needs explicit user approval anyway).
- Deploying to the VPS.
- Modifying ops.html (separate deployment artifact, would change non-React behavior).
- Modifying n8n workflows or the database.
- Scrubbing CLAUDE.md of operational hostnames — defer to user.
