

GDA Product Requirements Document

Objective

Build a simplified, trustworthy GDA platform that removes redundancy, preserves the live data core, and restores operator confidence through clearer architecture, explicit navigation, and controlled releases.[cite:215][cite:251]

Users

Primary user: Shawn Seffernick. The product should optimize for executive visibility, opportunity qualification, financial awareness, proposal support, and fast drill-down from summary to detail.[cite:215]

Must-have outcomes

- A persistent financial KPI header on all pages.[cite:251]
- A Launchpad that summarizes the platform and shows the top 10 scoring opportunities. [cite:198][cite:201]
- A single authoritative Ops Tracker for opportunities.
- A clearly separate qualified Pipeline view.
- Dedicated modules for Financial Bible, Prompt Architect, Compliance Matrix, and Proposal Review.
- No charts in the first implementation.

Global navigation requirements

Persistent header

The top KPI strip must appear on every page and contain:

- Orders
- Sales
- EBIT
- ROS
- Funded Backlog
- Backlog
- Gross Profit

Each KPI must be clickable and navigate to the view or filtered table that explains that value. [cite:251]

Local page summary row

A second summary strip must appear below the persistent header and change with the active module. It should summarize the tool the user is currently working in without repeating the financial KPI strip.[cite:198][cite:201]

Launchpad requirements

Functional

Launchpad must display:

- Top 10 scoring opportunities
- Active risks
- Decisions coming up
- Due-soon items
- Fast-track signals
- Navigation into the five core tools
- Placeholder area for relevant business news

Interaction

Each summary item should click into the specific underlying page or filtered view. Launchpad is not just a dashboard; it is the summary navigation layer for the platform.[cite:198][cite:201]

Data rules

Launchpad's top 10 must represent the highest scoring opportunities, not the top 10 pipeline items. Opportunity and pipeline are different concepts and must not be blended.[cite:198][cite:201]

Ops Tracker requirements

Ops Tracker must be the single place for detailed opportunity management. It must support filtering and sorting by department, probability of win, value, and status, with a clear mechanism to qualify an opportunity into pipeline.

Pipeline requirements

Pipeline must show only opportunities that have been explicitly qualified. It must not auto-include the full discovery universe.[cite:198][cite:201]

Financial Bible requirements

Financial Bible must contain the drill-downs for Orders, Sales, EBIT, ROS, Funded Backlog, Backlog, and Gross Profit. Each KPI in the persistent header must route here or to a closely related financial detail view.[cite:251]

Non-goals

- No Morning Brief or SitRep in the rebuilt scope.[cite:251]
- No charts or graphs in the first implementation.[cite:218]
- No duplicate document/intel/chat/research surfaces in the long-term product structure.[cite:215]
- No reliance on Retool as a parallel product surface.[cite:215]

Technical requirements

- React is the production UI.[cite:215]
- Postgres is the system of record.[cite:215]
- n8n remains the workflow engine where appropriate.[cite:215]
- React should only call safe relative `/api/...` routes.[cite:215]
- All React-facing endpoints must return a standard response envelope including success state, workflow identity, action, data, metadata, and structured errors.[cite:216]

Acceptance criteria

A release is acceptable when:

- The persistent financial KPI strip appears on all pages and routes correctly.[cite:251]
- Launchpad displays real top 10 scoring opportunities and summary data.[cite:198]
[cite:201]
- Ops Tracker and Pipeline are clearly separated.
- Endpoint failures are visible and diagnosable in the UI because responses use the standard JSON contract.[cite:216]
- Smoke tests and the selected E2E journeys pass before release.[cite:218]
