

GDA Product Roadmap

Product vision

GDA should become Shawn's operating system for business development, capture, financial visibility, proposal work, and controlled AI-assisted execution.[cite:215] The goal is not to accumulate more workflows, but to create a reliable product surface built on top of stable data, explicit APIs, and testable operations.[cite:215][cite:216]

Product structure

Persistent global layer

Every page will contain a financial-only KPI header with:

- Orders
- Sales
- EBIT
- ROS
- Funded Backlog
- Backlog
- Gross Profit

These KPIs are persistent and clickable across the platform, and each should route to the exact underlying financial detail it represents.[cite:251]

Local page layer

Every page will also have a second summary row that is specific to the active tool. This row changes by context and summarizes the active module rather than repeating the global financial KPIs.[cite:198][cite:201]

Core tools

1. Launchpad

Launchpad is the platform welcome page and executive summary. It should show the top 10 scoring opportunities, risks, due-soon items, decisions coming up, fast-track signals, and links into the core tools.[cite:198][cite:201]

2. Ops Tracker

Ops Tracker is the single place for opportunity discovery and management before qualification. It should support sorting and filtering by the 13 governmental departments, probability of win, value, and related opportunity fields.[cite:198][cite:201]

3. Financial Bible

Financial Bible is the destination for the persistent KPI strip. It houses the financial drill-down views behind Orders, Sales, EBIT, ROS, Funded Backlog, Backlog, and Gross Profit.[cite:251]

4. Prompt Architect

Prompt Architect will become the dedicated place for operational prompt generation and reuse. It should not be buried inside general chat or research tools.

5. Compliance Matrix

Compliance Matrix is the dedicated compliance workspace and should not be duplicated inside proposal or document screens.

6. Proposal Review

Proposal Review is the dedicated proposal evaluation and review environment.

7. Document/Intel Workbench (later)

Doc Hub, PPT, AI Agent Chat, Deep Research, Intel Feed, and Competitive Intel are overlapping enough that they should be merged into one future workbench rather than preserved as separate products.[cite:215]

Product rules

A record is an opportunity until Shawn qualifies it. Only then does it become pipeline. The roadmap, API model, UI views, and later charts must all respect that rule.[cite:198][cite:201]

Charts are deferred until after the table, filtering, and drill-down layers are correct. The first releases focus on trustworthy lists, tables, summaries, and navigation.[cite:218]

Delivery phases

Phase 1 — Trustworthy Launchpad

Deliver a new Launchpad backed by explicit API contracts and direct DB truth. It should include the persistent financial KPI strip, Launchpad-specific summary cards, top 10 scoring opportunities, and navigation into the core tools.[cite:216][cite:218]

Phase 2 — Ops Tracker and Pipeline separation

Deliver a clean Ops Tracker for opportunity management and a separate qualified Pipeline view. Launchpad may summarize both, but detailed tables must live in one place only.[cite:198]
[cite:201]

Phase 3 — Financial Bible and drill-downs

Deliver the views behind the persistent KPI strip so those numbers become actionable, not decorative.[cite:251]

Phase 4 — Prompt Architect, Compliance Matrix, Proposal Review

Add the remaining core tools after the Launchpad and data-navigation foundations are stable.

Phase 5 — Consolidated Document/Intel Workbench

Merge the fragmented document, research, and intel tools into one coherent workspace.

Phase 6 — Visual layer

Add charts and graphs only after the data model and page architecture are stable. The funnel must respect the rule that an opportunity does not become pipeline until it is qualified.
[cite:198][cite:201]
